## **CASE STUDY**

---

South Africa faces a significant challenge - economic inequality. This case study aims to define the core issues surrounding economic inequality in South Africa, particularly focusing on key socioeconomic indicators such as income distribution, employment rates, and access to education.

The primary challenge lies in understanding and addressing the multifaceted issues faced by marginalised communities. These challenges include limited access to economic opportunities, disparities in education, and unequal resource distribution.

To comprehensively address economic inequality, it is crucial to delve into the root causes and identify manifestations in different sectors. The research employs diverse methods, including data analysis and interviews with affected communities, to gain a nuanced understanding of the issues.

A detailed project plan is essential, outlining key milestones, a summary of research used, and a risk assessment. An executive summary will provide an overview of the case study, setting the stage for proposed solutions.

To combat economic inequality, the case study needs to provide a range of solutions. These encompass policy changes, community empowerment initiatives, and educational reforms. The emphasis is on adopting a comprehensive and inclusive approach to bridge the economic gap effectively.

To bring about sustainable change, practical steps for implementing the proposed solutions are discussed. The importance of collaboration between government, NGOs, and local communities is highlighted. This is deemed crucial for successful execution.

**Please ensure that you are prepared to present the proposal above to a panel. You will have 10 mins for the presentation.**
